Backend engineer with four-plus years building distributed microservices in Java 17, Spring Boot and Google Cloud. I currently maintain critical components of a mobile-first platform with 100,000+ downloads across Chile, Colombia and Peru; before that, transactional services at a payment processor. I design API-First REST services and event-driven integrations on Pub/Sub, and use AI tooling (Claude Code) in the development workflow for requirements analysis, test generation and code review.

Experience

Backend Engineer (consultant) · Seidor, for Flexit (flexible staffing, Chile · Colombia · Peru) Jun 2026 – present

- Maintain and evolve the platform's 21 Java 17 / Spring Boot microservices on GCP with Cloud Run, Cloud SQL (PostgreSQL) and Pub/Sub, including authentication, registration, schedulers and cron jobs.
- Redesigned the user registration flow (7 stages, 24 sub-stages) so a single codebase supports per-country rules; this is what unlocked the launch in Colombia and Peru.
- Built and maintain the two Backend-for-Frontend services (mobile and web) that orchestrate the domain microservices and decouple each channel from the rest of the platform.
- Designed event-driven async integrations on Pub/Sub for batch processes, and deploy with GitHub, Docker, Kubernetes and Cloud Run under continuous integration.
- Standardised endpoint documentation and versioning with Bruno under API-First / OpenAPI, replacing scattered personal Postman collections with a single Git-versioned source.

Fullstack Developer Specialist · EVERTEC, payment processor Mar 2025 – Jun 2026

- Developed and maintained high-availability financial microservices in Java, Spring Boot and Apache Camel, integrating third-party REST APIs in mission-critical transactional flows.
- Implemented centralised error handling that improved production incident traceability and shortened bug resolution in payment flows.
- Reduced service cyclomatic complexity by applying SOLID and modular architecture, making critical components easier to operate and extend.

Fullstack Software Developer · ADVISE Dec 2022 – Mar 2025

- Delivered enterprise applications end to end (requirements, architecture, development, testing, deployment) with Spring Boot, NestJS and React on PostgreSQL and MongoDB.
- Architected PostalExpress (Vue, Go, Tailwind), a parcel-management platform the client used to centralise its shipping operations.
- Refactored legacy modules and optimised SQL queries to cut response times and technical debt.

Software Developer · Eleva Jan – Jul 2022

- Internship converted into a developer contract: built SILL, a technology-inventory control system (Vue, Django, PostgreSQL).

Projects

- **softrent.cl** · Rental-management platform (Spring Boot, Vue, PostgreSQL) integrating Chilean payment gateways (Fintoc, Khipu, Floid) for transaction validation.

Technical stack

Backend: Java 17, Spring Boot, Apache Camel, NestJS, Node.js, Django
Cloud & DevOps: GCP (Cloud Run, Cloud SQL, Pub/Sub, Cloud Storage, Firebase, BigQuery), Docker, Kubernetes, GitHub Actions, Azure, AWS
Architecture: Microservices, distributed architectures, event-driven, BFF, REST, GraphQL, SOAP, API-First (OpenAPI, Bruno), Clean Architecture, SOLID, 12-Factor
Data: PostgreSQL, MongoDB, SQL Server, Oracle, BigQuery
Testing: JUnit, Mockito, TDD, testing pyramid
Frontend (complementary): React, Next.js, Vue, TypeScript
Tools: Git, GitHub, GitLab, Bruno, Jira, IntelliJ, VS Code, Claude Code

Education

B.S. in Computer Engineering & Informatics · Universidad Andrés Bello · 2024 – 2026
Associate Degree, Systems Analysis & Programming · AIEP Professional Institute · 2020 – 2022

Certifications & languages

Microsoft Certified: Azure Fundamentals (AZ-900), 2024 · **MongoDB Associate Developer**, 2024
Languages: Spanish (native) · English (advanced, professional working proficiency)
